

WEEK 4 QUIZ 1

Neural Networks: Representation

Technique Skip

TOTAL POINTS 5

1. Which of the following statements are true? Check all that apply.

1 point

- ☒ Any logical function over binary-valued (0 or 1) inputs x_1 and x_2 can be (approximately) represented using some neural network.
 - ☒ The activation values of the hidden units in a neural network, with the sigmoid activation function applied at every layer, are always in the range (0, 1).
 - ☐ Suppose you have a multi-class classification problem with three classes, trained with a 3 layer network. Let $a_1^{(3)} = (h_{\theta}(x))_1$ be the activation of the first output unit, and similarly $a_2^{(3)} = (h_{\theta}(x))_2$ and $a_3^{(3)} = (h_{\theta}(x))_3$. Then for any input x , it must be the case that $a_1^{(3)} + a_2^{(3)} + a_3^{(3)} = 1$.
 - ☐ A two layer (one input layer, one output layer; no hidden layer) neural network can represent the XOR function.
-

2. Consider the following neural network which takes two binary-valued inputs $x_1, x_2 \in \{0, 1\}$ and outputs $h_{\Theta}(x)$. Which of the following logical functions does it (approximately) compute?

1 point

- ☒ OR
- ☐ AND
- ☐ NAND (meaning "NOT AND")
- ☐ XOR (exclusive OR)

3. Consider the neural network given below. Which of the following equations correctly computes the activation $a_1^{(3)}$? Note: $g(z)$ is the sigmoid activation function.

1 point

- ☒ $a_1^{(3)} = g(\Theta_{1,0}^{(2)}a_0^{(2)} + \Theta_{1,1}^{(2)}a_1^{(2)} + \Theta_{1,2}^{(2)}a_2^{(2)})$
- ☐ $a_1^{(3)} = g(\Theta_{1,0}^{(1)}a_0^{(1)} + \Theta_{1,1}^{(1)}a_1^{(1)} + \Theta_{1,2}^{(1)}a_2^{(1)})$
- ☐ $a_1^{(3)} = g(\Theta_{1,0}^{(1)}a_0^{(2)} + \Theta_{1,1}^{(1)}a_1^{(2)} + \Theta_{1,2}^{(1)}a_2^{(2)})$
- ☐ The activation $a_1^{(3)}$ is not present in this network.

4. You have the following neural network:

1 point

Rectangular Snip

You'd like to compute the activations of the hidden layer $a^{(2)} \in \mathbb{R}^3$. One way to do so is the following Octave code:

```
% Theta1 is Theta with superscript "(1)" from lecture
% ie, the matrix of parameters for the mapping from layer 1 (input) to layer 2
% Theta1 has size 3x3
% Assume 'sigmoid' is a built-in function to compute 1 / (1 + exp(-z))

a2 = zeros (3, 1);
for i = 1:3
    for j = 1:3
        a2(i) = a2(i) + x(j) * Theta1(i, j);
    end
    a2(i) = sigmoid (a2(i));
end
```

You want to have a vectorized implementation of this (i.e., one that does not use for loops). Which of the following implementations correctly compute $a^{(2)}$? Check all that apply.

- ☒ `z = Theta1 * x; a2 = sigmoid (z);`
- ☐ `a2 = sigmoid (x * Theta1);`
- ☐ `a2 = sigmoid (Theta2 * x);`
- ☐ `z = sigmoid(x); a2 = sigmoid (Theta1 * z);`

5. You are using the neural network pictured below and have learned the parameters

1 point

$\Theta^{(1)} = \begin{bmatrix} 1 & -1.5 & 3.7 \\ 1 & 5.1 & 2.3 \end{bmatrix}$ (used to compute $a^{(2)}$) and $\Theta^{(2)} = [1 \quad 0.6 \quad -0.8]$ (used to compute $a^{(3)}$)

as a function of $a^{(2)}$). Suppose you swap the parameters for the first hidden layer between its two units so

$\Theta^{(1)} = \begin{bmatrix} 1 & 5.1 & 2.3 \\ 1 & -1.5 & 3.7 \end{bmatrix}$ and also swap the output layer so $\Theta^{(2)} = [1 \quad -0.8 \quad 0.6]$. How will this

change the value of the output $h_{\Theta}(x)$?

- ☒ It will stay the same.
- ☐ It will increase.
- ☐ It will decrease
- ☐ Insufficient information to tell; it may increase or decrease.
